NAME

CUTEST_cisgr_threaded − CUTEst tool to evaluate the gradient of a problem function in sparse format

SYNOPSIS

CALL CUTEST_cisgr_threaded(status, n, iprob, X, nnzg, lg, G_val, G_var, thread)

For real rather than double precision arguments, instead

CALL CUTEST_cisgr_threaded_s(...)

DESCRIPTION

The CUTEST_cisgr_threaded subroutine evaluates the gradient of either the objective function or a constraint function of the problem decoded from a SIF file by the script *sifdecoder* at the point X, in the constrained minimization case. The gradient is stored in sparse format. The problem under consideration is to minimize or maximize an objective function $f(x)$ o ver all $x \in R^n$ subject to general equations$c_i(x) = 0$, $(i \in 1, \ldots, m_E)$, general inequalities $c_i^l \leq c_i(x) \leq c_i^{u,}$ $(i \in m_E + 1, \ldots, m)$, and simple bounds $x^l \leq x \leq x^{u.}$ The objective function is group-partially separable and all constraint functions are partially separable.

ARGUMENTS

The arguments of CUTEST_cisgr_threaded are as follows

status [out] - integer
the outputr status: 0 for a succesful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error, 4 for an out-of-range thread,

n [in] - integer
the number of variables for the problem,

iprob [in] - integer
the number of the problem function to be considered. If iprob = 0, the value of the objective function will be evaluated, while if iprob = i > 0, that of the i-th constraint will be evaluated,

X [in] - real/double precision
an array which gives the current estimate of the solution of the problem,

nnzg [out] - integer
the number of nonzeros in G_val,

lg [in] - integer
the declared length of G_val and G_var,

G_val [out] - real/double precision
an array which gives the nonzeros of the gradient of constraint function icon evaluated at X. The i-th entry of G_val gives the value of the derivative with respect to variable G_var(i) of function icon.

G_var [out] - integer
an array whose i-th component is the index of the variable with respect to which G_val(i) is the derivative,

thread [in] - integer
thread chosen for the evaluation; threads are numbered from 1 to the value threads set when calling CUTEST_csetup_threaded.
