

NAME

CUTEST_cigr_threaded – CUTEst tool to evaluate the gradient of a problem function.

SYNOPSIS

CALL CUTEST_cigr_threaded(status, n, iprob, X, G_val, thread)

For real rather than double precision arguments, instead

CALL CUTEST_cigr_threaded_s(...)

DESCRIPTION

The CUTEST_cigr_threaded subroutine evaluates the gradient of either the objective function or a constraint function of the problem decoded from a SIF file by the script *sifdecoder* at the point X , in the constrained minimization case. The problem under consideration is to minimize or maximize an objective function $f(x)$ over all $x \in R^n$ subject to general equations $c_i(x) = 0$, ($i \in 1, \dots, m_E$), general inequalities $c_i^l \leq c_i(x) \leq c_i^u$ ($i \in m_E + 1, \dots, m$), and simple bounds $x^l \leq x \leq x^u$. The objective function is group-partially separable and all constraint functions are partially separable.

ARGUMENTS

The arguments of CUTEST_cigr_threaded are as follows

status [out] - integer

the output status: 0 for a successful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error, 4 for an out-of-range thread,

n [in] - integer

the number of variables for the problem,

iprob [in] - integer

the number of the problem function to be considered. If $\text{iprob} = 0$, the value of the objective function will be evaluated, while if $\text{iprob} = i > 0$, that of the i -th constraint will be evaluated,

X [in] - real/double precision

an array which gives the current estimate of the solution of the problem,

G_val [out] - real/double precision

an array which gives the gradient of problem function iprob evaluated at X ,

thread [in] - integer

thread chosen for the evaluation; threads are numbered from 1 to the value threads set when calling CUTEST_csetup_threaded.
