## **NAME**

CUTEST\_cdimsg – CUTEst tool to determine the number of nonzeros needed to store the sparse gradient of the objective function for the problem decoded from a SIF file by the script *sifdecoder*.

## **SYNOPSIS**

```
CALL CUTEST_cdimsg( status, nnzg )
```

For real rather than double precision arguments, instead

```
CALL CUTEST_cdimsg_s( ... )
```

## DESCRIPTION

The CUTEST\_cdimsg subroutine determines the number of nonzero elements required to store the gradient of the objective function for the problem decoded into OUTSDIF.d in the constrained minimization case. The gradient is stored in sparse format, i.e., only the indices and values of components that may be nonzero are stored.

The problem under consideration is to minimize or maximize an objective function f(x) over all  $x \in \mathbb{R}^n$  subject to general equations  $c_i(x) = 0$ ,  $(i \in 1, ..., m_E)$ , general inequalities  $c_i^l \le c_i(x) \le c_i^u$ ,  $(i \in m_E + 1, ..., m)$ , and simple bounds  $x^l \le x \le x^u$ . The objective function is group-partially separable and all constraint functions are partially separable.

# **ARGUMENTS**

The arguments of CUTEST\_cdimsg are as follows

```
status [out] - integer
```

the outputr status: 0 for a successful call, 1 for an array allocation/deallocation error, 2 for an array bound error, 3 for an evaluation error,

```
nnzg [out] - integer
```

the number of nonzero elements required to store the gradient.
